                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with

                                                                                                                                                                                                                                                                                                                                                                                                                                               ABK29280 standard; DNA;
                                                                                                                                                                   20-DEC-2001.
                                                                                                                                                                                                                                                                                                                                                                      23-APR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABKZ9026-ABKZ9474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of detecting and quantifying fungi a bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and the continuous continuous chain reaction (PCR) and fluorescent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                                      The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the bapple, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific partice sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABK29289,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 22 BP; 7 A; 8 C; 6 G; 1 T; 0 other;

The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting and quantifying fungi and bacteria, involves obtaining a sequence of the fungus, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction and fluorescent probe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting and quantifying fungi and bacteria, involves obtaining a sequence of the fungus, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction and fluorescent probe analysis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;

The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 77; Page

                                                                                                                                                sequences unique to the species/group of species but common to all isolates of the species/group of species. The method especially employs sequences selected from 225 fungal and bacterial primer and probe sequences (ABN99429-ABN99653) for detection of specified fungifungal groups or specified bacteria. The method enables detection and quantification of specific fungi or bacteria, or groups of fungal/bacterial species, useful medically for diagnosis and treatment of fungi or bacteria associated with health problems such as infections, gastroenteritis, ulcers, asthma, allergies and sinusitis. It is also useful to detect and/or quantify microorganisms in the environment e.g. to establish the risk of adverse health effects (e.g. pulmonary haemorrhage from levels of Stachybotrys chartarum in air samples in
                                                                                                                                                                                                                                                                                                                         The invention relates to specific fungi or bacteria detected and quantified in a sample by extracting and recovering DNA from the organism in the sample and hybridising and amplifying the DNA sequence using
                                                                                                                                                                                                                                                                                                                                                                                  Claim 65;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABK29220;
                                                                                                                                                                                                                                                                                                                                                                         detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with DNA sequence system or other molecular probes like hybridisation. ABK29026-ABKZ9474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Trichoderma harzianum forward PCR primer.

The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequences unique to the species/group of species but common to all isolates of the species/group of species. The method especially employs sequences selected from 225 fungal and bacterial primer and probe sequences (ABN99429-ABN99653) for detection of specified fungi/fungal groups or specified bacteria. The method enables detection and quantification of specific fungi or bacteria, or groups of fungal/bacterial species, useful medically for diagnosis and treatment of fungi or bacteria associated with health problems such as infections, gastroenterits, ulcers, asthma, allergies and sinusitis. It is also useful to detect and/or quantify microorganisms in the environment e.g. to establish the risk of adverse health effects (e.g. pulmonary haemorrhage from levels of Stachybotrys chartarum in air samples in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in medical diagnosis and treatment of fungal and bacterial conditions, by hybridizing and amplifying DNA using sequences unique to the specie or group of species -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to specific fungi or bacteria detected and quantified in a sample by extracting and recovering DNA from the or in the sample and hybridising and amplifying the DNA sequence using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 63; Column 97;

The method especially employs sequences selected from 225 fungal and bacterial primer and probe sequences (ABN99429-ABN9953) for detection of specified fungi/fungal groups or specified bacteria. The method enables detection and quantification of specific fungi or bacteria, or groups of fungal/bacterial species, useful medically for diagnosis and treatment of fungi or bacteria associated with health problems such as infections, gastroenteritis, ulcers, asthma, allergies and shrusitis. It is also useful to detect and/or quantify microorganisms in the environment e.g. to establish the risk of adverse health effects (e.g. pulmonary hamorrhage from levels of Stachybotrys chartarum in air samples in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 quantified in the samp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 21

The invention relates to specific fungi or bacteria detected and quantified in a sample by extracting and recovering DNA from the organism in the sample and hybridising and amplifying the DNA sequence using sequences unique to the species/group of species but common to all isolates of the species/group of species. The method especially employs sequences selected from 225 fungal and bacterial primer and probe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    groups or specified bacteria. The method enables detection and quantification of specific fungi or bacteria, or groups of fungal/bacterial species, useful medically for diagnosis and treatment (fungi or bacteria associated with health problems such as infections, gastroenteritis, ulcers, asthma, allergies and sinusitis. It is also useful to detect and/or quantify microorganisms in the environment e.g. to establish the risk of adverse health effects (e.g. pulmonary haemorrhage from levels of Stachybotrys chartarum in air samples in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequences (ABN99429-ABN99653) for detection of specified figroups or specified bacteria. The method enables detection
                                       The invention relates to a method of detecting and quantifying fungi and bacteria; involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  23-APR-2002

                                                                                                                                                                                                                                            The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.

The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 67; Page 22; 110pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting and quantifying fungi and bacteria, involves obtaining a sequence of the fungus; extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction and fluorescent probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WO200196612-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Trichoderma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fungal detection; bacterial detection; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   quantified in a sample by extracting and recovering DNA from the organism of the sample and hybridising and amplifying the DNA sequence using sequences unique to the species/group of species but common to all solates of the species/group of species. The method especially employs sequences selected from 225 fungal and bacterial primer and probe sequences (ABN99429-ABN9963) for detection of specified fungal/fungal groups or specified bacteria. The method enables detection and quantification of specific fungal or bacteria, or groups of fungal/bacterial species, useful medically for diagnosis and treatment of fungal or bacteria, sulcers, asthma, allergies and sinusitis. It is also useful to detect and/or quantify microorganisms in the environment e.g. to establish the risk of adverse health effects (e.g. pulmonary hamonary and some samples in Schener's asthma, allergies and sinusitis. It is also set to establish the risk of adverse health effects (e.g. pulmonary to be set to set t

                                                                 Query Match
                                                                                                                            The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.

```

The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes Detecting and quantifying fungi and bacteria, involves obtaining sequence of the fungus, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction and fluorescent F Claim 83; analysis Page 24, 110pp; English probe

                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting and quantifying fungi and bacteria, involves obtaining a sequence of the fungus, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction and fluorescent probe analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Haugland
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Aspergillus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABK29271 standard; DNA;

RNA genes by the primers AAQ94359-93 and AAT05357-72. These primers are desived from the ITS sequences of these fungi (AAT0534-T05404 and AAQ94398) and are strain specific. The amplification products of the reactions using these primers can be used with the capture primers AAT05378-93 in colourimetric assays. The primers and ITS DNAs can be used for the detection of specific fungal pathogen isolates and in monitoring diseas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Plant pathogen; fungus; Septoria nodorum; Septoria tritici; Pusari

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAV62507 to AAV62566 represent species specific PCR primers for various fungal isolates used for fungal detection in the course of the invention. The primers are designed based on the internal transcribed spacer (ITS) sequences of the various fungal species. The invention provides a DNA molecule isolated from the ribosomal RNA gene region of a fungal pathogen, where the DNA molecule consists of an ITS sequence selected from ITS1 and ITS2 of Fusarium culmorum, Fusarium graminearum, Fusarium moniliforme, Septoria avenae or Microdochicum nivale. A method for detecting F. graminearum, F. culmorum, F. moniliforme, F. poae, F. avenaceum and M. nivale isolates is also provided which comprises isolating DNA from a plant leaf infected with at least one of the above pathogens and amplifying parts of the ITS sequence of the pathogen(s) pCR using specific primers from within these sequences. The pathogen(s) are detected by visualising the amplified part

This invention describes a novel recombinant antibody (Ab) that binds continued and product of the invention has cytostatic, antibacterial, convincide, fungicide and protozoacide activity. Complexes of gp96 with the peptides of the invention induce a immune response (cytotoxic T cells) consectific for the associated peptides. Ab are used for purification or convince a immune response (cytotoxic T cells) converting of gp96, including intect complexes (C) with peptides (I), from converting amounts of tumour or infected cells. (C) are useful: (i) in human cytoxic and infections (by viruses, bacteria, mycoplasma, fungi and parasites (C) protozoa); and (ii) for raising anti-idiotypic antibodies. Ab make cytostable isolation of very pure gp96 in native form, even from small contaminate the final product by bleeding from the column). This sequence concamvalin A (as used in known processes and which may contaminate the final product by bleeding from the column). This sequence concamvalin action complementarity determining region (CDR3) fragment of the antibody raised against human gp96 described in two contaminates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Terness P,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences unique to the species/group of species but common to all isolates of the species/group of species. The method especially employs sequences selected from 225 fungal and bacterial primer and probe sequences (ABN99429-ABN9963) for detection of specified fungi/fungal groups or specified bacteria. The method enables detection and quantification of specific fungi or bacteria, or groups of fungal/bacterial species, useful medically for diagnosis and treatment fungi or bacteria associated with health problems such as infections, gastroenteritis, ulcers, asthma, allergies and shus: its lis also useful to detect and/or quantify microorganisms in the environment e.g. to establish the risk of adverse health effects (e.g. pulmonary haemorrhage from levels of Stachybotrys chartarum in air samples in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection in medical by hybridi

The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABX29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                        PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY16734-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 17

                                                                         밁
                                                                                                  This invention describes a novel group of primer pairs for polymerase chain reaction (PCR) amplification of at least one genetic element (A), introduced by genetic modification of soya, maize or other plants, present in crude plant materials or derived compositions. The new primers and probes are used (i) to detect and/or quantify genetically modified plant materials in seeds, animal and human foodstuffs, especially where these have been processed so that DNA is extensively degraded and (ii) of for monitoring the amplification of (A). The probes may also be used to confirm a successful PCR amplification. The high annualing temperature of the primers ensures high specificity and sensitivity, even with badly degraded samples, and facilitates analysis by restriction analysis, since conly inexpensive restriction enzymes are required, reducing costs and comply inexpensive restriction enzymes are required, reducing costs and comply inexpensive restriction enzymes are required, reducing costs and comply inexpensive restriction enzymes are required, reducing costs and comply inexpensive restriction enzymes are required, reducing costs and comply inexpensive restriction enzymes are required, reducing costs and materials. AAR61845 represent the PCR primersused in the method of the invention which amplify the soybean (Glycine max) lectin gene, Zea mays invertase gene, Cauliflower Mosaic virus (caMV) 35s-promoter, and comply incomposin phosphotransferase) gene, Petunia hybrida comply incomposin phosphotransferase) gene, Petunia hybrida comply incomposin smodified Cryla(b) gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to an antisense compound 8 to 30 bases in length targeted to the 5' untranslated (UTR) region, the coding region or the 3' UTR region human Integrin-linked kinase (hIK). The antisense oligonucleotides are useful for inhibiting the expression of human hIK in human cells or tissues, in vitro. The oligonucleotides can be utilized for diagnostics, therapeutics for the treatment of diseases associated with the expression of hIK, prophylaxis e.g. to prevent or delay infection, inflammation or tumor formation and as research reagent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAF69341 standard; DNA; 20 BP

                                                                                                                                                                                                                                                                                                                                                                                                     C(I) have melting temperatures within a narrow range. The method is useful CC for detecting infectious diseases caused by bacterial infectious agents CC e.g. Salmonella, bisteria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and CC Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, CC Epstein-Barr virus and polio virus, and parasitic infectious agents CC elected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus CC medinesis. The method is also useful for detecting genetic diseases such CC as 21 hydroxylase deficiency, Turner Syndrome and objectly defects. CC entecting cancer involving oncogenes, tumour suppressor genes, or genes CC involved in DNA amplification, replication, recombination or repair, the CC cancer is specifically associated with a gene selected from BRCA1 gene, CC garticular papillomavirus types 16 and 18 and liver cancers. The CC method is also used for emvironmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning CC electron microscope and infrared microscope) the support at the cCC sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to CC fe the present invention.

CC (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal CC infectious agents e.g. Cryptcocccus neoformans, Candida albicans and CC Aspergillus fundgautus, viruses e.g. T-cell lymphocytotrophis cirus, CC Epstein-Barr virus and pollo virus, and parasitic infectious agents CC medinesis. The method is also useful for detecting genetic diseases such CC electing cancer involving oncogenes, tumour suppressor genes, or genes CC involved in DNA amplification, replication, recombination or repair, the CC cancer is specifically associated with a gene selected from BRCA1 gene, by 3 gene, human papillomavirus types 16 and 18 and liver cancers. The CC method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning CC electron microscope and infrared microscope) the support at the food sets occurred and correlating (using a computer) identified ligation to a gresence or absence of the target nucleotide sequences. AB182074 to CC of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   infection; 21 hydroxylase deficiency; Turner Syndrome; obescancer; oncogene; tumour suppressor; human papillomavirus; environmental monitoring; food industry; feed industry; se

The method is useful CC for detecting infectious diseases caused by bacterial infectious agents CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and CC Aspergillus fundgautus, viruses e.g. T-cell lymphocytotrophis cirus, CC Epstein-Barr virus and polio virus, and parasitic infectious agents CC medinesis. The method is also useful for detecting genetic diseases such CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. CC electing cancer involving oncogenes, tumour suppressor genes, or genes CC involved in DNA amplification, replication, recombination or repair, the CC cancer is specifically associated with a gene selected from BRCA1 gene, CC grant feed industry, detecting comprises scanning (using e.g. a scanning CC and feed industry, detecting comprises scanning (using e.g. a scanning CC sets occurred and correlating (using a computer) intention to a presence or absence of the target nucleotide sequences. ABI92074 to CC fethe areaent invention.

The promoter is isolated from a gene which is homologous to the barley pZE40 gene. The seed-specific promoter is used for selectively expressing a nucleotide sequence encoding a polypeptide involved in fatty acid metabolism, protein metabolism, carbohydrate metabolism, phytohormone biosynthesis or in cell cycle regulation. The promoter may be used to produce transgenic plants. The genes of interest expressed by the promoter are also useful for varying the phenotype of seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein metabolism; carbohydrate metabolism;

Aquaporin (AQP) is a family of water channel proteins, through which water is transported into and out of cells - ten types of mammalian AQP have been identified so far. The invention also comprises an oligonucleotide (OGN) chip having 902 oligonucleotide primer sequences and a cDNA chip comprising one or more sequences from the human AQP5 gene is useful for disgnosing cancer (i.e lung cancer). The OGN chip is useful for detecting mutations and polymorphisms in AQP5 and the cDNA chip is useful for analysis of gene expression. The present DNA sequence represents a human aquaporin 5 (AQP5) gene oligonucleotide (OGN) chip PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Moon

The method comprises contacting the skin with an CC of skin disorders. The method comprises contacting the skin with an CC exceptor, IgF binding protein [IGFB]. The Growth Factor [IGF] of CC inhibiting or reducing growth factor mediated cell proliferation, CC inflammation and/or other disorders. The present sequence is an CC oligonucleotide which can be used to design the antisense CC oligonucleotide which can be used to design the antisense CC oligonucleotides of the present invention (see AP45151 and AP45153-F45161). The method is useful for amellorating the effects of CC psoriasis, inchhyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, CC psoriasis, neoplasias, scleroderma, warts, benign growths, cancers of the Skin, a hyperneovascular condition such as a neovascular condition of the skin, brain or skin, growth factor-mediated malignancies, other CC sclerotic disease, kidney disease, hyperproliferation of the inside of CC blood vessels or any other hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś

The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [GGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45.51 and AAF45.53-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Iraulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; lethyosis; serborrhoea; ruba; keratosis; neoplasia; seleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                      Amellorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisum nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
The present invention relates to a method for ameliorating the effects of skin disorders line method comprises contacting the skin with an antisense oligonucleotide, (for insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2001-041421/05.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         21-JUN-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oligonuclectides of the present invention (see ARF45151 and ARF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia.
                                                   A novel method for the detection of plant pathogenic strains of fungies. Septoria nodorum, S.tritici, Pseudocercosportella herpotrichoides, Mycosphaerella fijiensis, M.musicola or Fusarium spp, involves the PCR amplification of sequences found in the internal transcribed region (ITS) of the 185, 5.85 and 285 ribospomal RNA genes by the primers ARQ94359-93 and ANTO5357-72. These primers are derived from the ITS sequences of these fungi (ANTO5394-T05404 and ANQ94398) and are strain specific. The amplification products of the reactions using these primers can be used with the capture primers ANTO5378-93 in colourimetric assays. The primers and ITS DNAs can be used for the detection of specific fungal pathogen isolates and in monitoring diseas development in plant populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;

                                                                                                                                                                                                                                                                        A novel method for the detection of plant pathogenic strains of fungite. 9. Septoria nodorum, S.tritici, Pseudocercosporella herpotrichoides, Mycosphaerella fijiensis, M.musicola or Fusarium spp, involves the PCR amplification of sequences found in the internal transcribed region (ITS) of the 185, 5.85 and 288 ribosomal RNA genes by the primers AAQ94359-93 and AAT05357-72. These primers are derived from the ITS sequences of these fungi (AAT05394-T05404 and AAQ94398) and are strain specific. The amplification products of the reactions using these primers can be used with the capture primers AAT05378-93 in colourimetric assays. The primers and ITS DNAs can be used for the detection of specific fungal pathogen isolates and in monitoring disease development in plant populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Plant pathogen; fungus; Septoria nodorum; Septoria tritici; Fusarium; Pseudocercosporella harpotrichoides; Mycosphaerella fijiensis; PCR; Mycosphaerella musicola; amplification; primer; ribosomal RNA gene; internal transcribed region; strain; capture; colourimetric assay; isolate; development; population; ss.

Dudycz LW;

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line.

Ribozymes having modified bases and methods for use in inhibiting disease related genes

for

producing

them

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                       Sequences AAV62507 to AAV62566 represent species specific PCR primers for various fungal isolates used for fungal detection in the course of the invention. The primers are designed based on the internal transcribed spacer (ITS) sequences of the various fungal species. The invention provides a DNA molecule isolated from the ribosomal RNA gene region of a fungal pathogen, where the DNA molecule consists of an ITS sequence selected from ITS1 and ITS2 of Fusarium culmorum, Fusarium
                                                                                                                                                                                                                                                                                                                                                                                                 DNA isolated from fungal RNA, and its internal transcribed spacer sequence - used for detecting fungal pathogens in plant tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    02-JUL-1997;

A method for detecting F. graminearum, F. culmorum, F. moniliforme, F. poae, F. avenaceum and M. nivale isolates is also provided which comprises isolating DNA from a plant leaf infected with at least one of the above pathogens and amplifying parts of the ITS sequence of the pathogen(s) by PCR using specific primers from within these sequences. The pathogen(s) are detected by visualising the amplified part
                                                                                                                                                               sequences. The patho of the ITS sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to specific fungi or bacteria detected and converting and sample by extracting and recovering DNA from the organism continues and in a sample by extracting and recovering DNA from the organism continues and probability and supplied the DNA sequence using continues unique to the species/group of species but common to all continues of the species/group of species. The method especially employs sequences of the species/group of species. The method especially employs continues and species and species and probe continues of specific fungal species and specific for specific on of specified fungal species and specific fungal species of continues of specific fungal species, useful medically for disgnosis and treatment of supplication of specific fungal medically for disgnosis and treatment of control to detect and/or quantify microorganisms in the environment e.g. constablish the risk of adverse health effects (e.g. pulmonary for bourses) as the samples in bourses health effects (e.g. pulmonary controls).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The invention relates to specific fungi or bacteria detected and quantified in a sample by extracting and recovering DNA from the organism in the sample and hybridising and amplifying the DNA sequence using sequences unique to the species/group of species. The method especially employs sequences selected from 225 fungal and bacterial primer and probe sequences (ANN99429-ABN99653) for detection of specified fungi/fungal groups or specified bacteria. The method enables detection and quantification of specific fungi or bacteria, or groups of fungal/bacterial species, useful medically for diagnosis and treatment of fungi or bacteria associated with health problems such as infections, quastroenteritis, ulcers, asthma, allergies and sinusitis. It is also
                                                                                                                                                                                                        Claim 36; Column 94; 55pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation, ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes

                                                                                                                                                                               The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABX29026-ABX29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                             Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting and quantifying fungi and bacteria, involves obtaining sequence of the fungus, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction and fluorescent property.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Haugland R,

                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an CC antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 CC receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of cinhibiting or reducing growth factor mediated cell proliferation, CC inflammation and/or other disorders. The present sequence is an CC oligonucleotide which can be used to design the antisense CC oligonucleotides of the present invention (see AAF45151 and CC oligonucleotides of the present invention (see AAF45151 and CC psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, CC psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, CC skin, a hyperneovascular condition such as a neovascular condition of the cetina, brain or skin, growth factor-mediated malignancies, other collects of klord versels and crant other threaten, browerls, being growth inside of the inside of collects of versels and crant other threaten.

                                                                                      The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contracting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina brain or skin or work for a retormandiared malitonancies of the

                                                                                                                                                                                                                                                                                                                                                                                                                 oestrogen, but does respond to tamoxifen. The fusion proteins are used to induce selective proliferation (in vivo or in vitro), of cells the invention are expected to contain an exogenous gene. The fusion proteins of the invention are particularly useful in gene therapy where haematopoletic stem cells are being targeted. Selective proliferation of of cells through fusion proteins allows effective gene therapy even where gene transfer efficiency is low. Also, since the fusion proteins can be expressed in various types of blood cells, the range of cells that can be targeted is enlarged. The present DNA sequence represents a PCR primer used in an example of the invention to amplify the coding sequence of the hormone binding domain (HBD) of the mouse 4-hydroxytamoxifen-responsive

The protein has a molecular weight of 11 kD. The present invention additionally discloses an antagonist of thyroglobulin 11 for therapeutic use, and an antibody which specifically binds to thyroglobulin 11. Thyroglobulin 11, and nucleotides which encode it may be used for treating thyroid-associated diseases, such as goitre, thyroiditis, hypothyroidism, hyperthyroidism, and struma nodosa (adenomatous goitre). The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reactions or as a probe for hybridiastion reactions, or in producing gene chips or microarrays. Sequences hange 573-ABA96574 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human thyroglobulin 11 cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This oligonucleotide was used as 5' primer in the RT-PCR amplification of cDNA (see AXX59153) coding for a truncated, soluble human neuropilin-1 polypeptide (see AAY06319). The cDNA was cloned from a PC3 library. Neuropilin-1 is a novel vascular endothelial growth factor (VEGF) receptor that is expressed in endothelial cells and motile metastatic cancer cells. Claimed soluble neuropilin-1 polypeptides are useful for treatment of diseases or disorders associated with VEGF, e.g. metastasis, inappropriate angiogenesis, chronic inflammation, diabetic retinopathy and arthritis. Solid tumors can also be treated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gagnon

The invention describes a polynucleotide (I) of the endothelin (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) CC (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) CC (II) is useful for producing cells capable of expressing (I) co or (II) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (I), (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing and conclecular variant gene comprising (I) is useful for identifying and conclecular variant of a polypeptide of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product, or for identifying and obtaining an inhibitor of the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and composition for treating a cardiovascular disease such as coronary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polynucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polynucleotides, genes, vectors, polypeptides, antibodies or bost cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 6; Page 59; 190pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC (EDN)/endothelin converting enzyme (EED)/receptors of EDN and ECE (EDNR) (endothelin converting enzyme (EED)/receptors of EDN and ECE (EDNR) CC signaling system which is associated with a cardiovascular disease. (I), CC the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) CC or (III) is useful for producing cells capable of expressing a molecular CC variant polypeptide which is associated with a cardiovascular disease. (CC or (III), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing (I) a molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDR/ECE signaling system (CC or its gene product, or for identifying and obtaining an inhibitor of the activity of a molecular variant of a polypeptide of the EDN/EDRR/ECE signaling system or its gene product. The isolated proteins and (CC polynucleotides encoding them are useful for preparation of a polynucleotides encoding them are useful for preparation of a coronary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial CC phypercholesteroleemia. The gene or a polynucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for CC comprising bolynucleotides, genes, vectors, polypeptides, antibodies or forention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding pathway. XX
